Kinetic gas to probe quantum gravity

- Gas is constituted by particles of equal mass.

Kinetic gas to probe quantum gravity

- Gas is constituted by particles of equal mass.
- Particle trajectories follow (relativistic) Hamiltonian dynamics.

Kinetic gas to probe quantum gravity

- Gas is constituted by particles of equal mass.
- Particle trajectories follow (relativistic) Hamiltonian dynamics.
- Each particle is described by (spacetime) position and four-momentum.

Kinetic gas to probe quantum gravity

Collisionless gas

Particle density function is constant along particle trajectories in phase space.

- Schwarzschild black hole:
 - Spherically symmetric spacetime.
 - Vacuum solution of Einstein's equations (general relativity).
 - **Unique solution with these properties (Birkhoff theorem).**

- Schwarzschild black hole:
 - Spherically symmetric spacetime.
 - Vacuum solution of Einstein's equations (general relativity).
 - Unique solution with these properties (Birkhoff theorem).
- κ -Poincaré modification of spacetime:
 - Interaction between particles and “quantum structure of spacetime”.
 - Interaction depends on de Broglie wavelength (momentum).
 - ↪ Distinguished time direction (vector field).
 - ⇒ κ -Minkowski spacetime has modified symmetry algebra.
 - Black hole spacetime: assume spherically symmetric vector field.
 - ⇒ Vector field may only have time and radial components.
 - Modification depends on a parameter ℓ (Planck length).
 - Spacetime approaches Schwarzschild for $\ell \rightarrow 0$.

Example: swarm of orbiting particles

- Particles of equal mass and energy.

Example: swarm of orbiting particles

- Particles of equal mass and energy.
- Gravitationally bound: orbit oscillates between two radii.

 - Assume spherically symmetric particle distribution.
 - Calculate particle density as function of radial coordinate.
- ⇒ κ -Poincaré modification decreases particle density.

- Summary:

- ⚡ Fundamental theory of quantum gravity is unknown.
- ⇒ Consider effective quantum gravity models instead.
 - Effective model is small correction to general relativity.
- ⇒ Study observable effects of possible quantum corrections.
 - κ -Poincaré modification changes matter density near black hole.

 - Effective model is small correction to general relativity.
- ⇒ Study observable effects of possible quantum corrections.
 - κ -Poincaré modification changes matter density near black hole.

- Outlook:

- Consider more general quantum corrections.
- Consider spinning black holes.
- Consider more general gases or matter distributions with less symmetry:
 - Accretion disks and jets \rightsquigarrow blazars.
 - Tidal disruption events.
 - Stellar wake of passing black hole and dynamical friction.
- Derive observable properties of black holes, quasars, AGN. . .
